Create a Touch-Free Environment

Though no one likes to think about it, we encounter potentially infected surfaces every day. Door handles, faucets, toilets, light switches and other high-touch surfaces can spread viruses from one person to another. Creating touch-free environments in your public spaces can help reduce the spread of germs.

High-Touch Areas

- Entryways
- Common Areas
- Restrooms
- Breakrooms

Why Switch to Sensor?

Sensor faucets **eliminate a touch point** for potential contamination. According to the CDC*:

- Washing your hands can help keep you healthy and minimize the spread of respiratory and diarrheal infections. Some of the ways germs can spread:
 - Touch your eyes, nose and mouth with unwashed hands
 - Prepare and/or consume food and/or drinks with unwashed hands
 - Touch contaminated surfaces and/or objects
 - Blow your nose, cough or sneeze into your hands before touching others' hands or common objects

Sensor faucets **save water** when compared to standard manual bathroom faucets.

- Flow rates of sensor faucets (0.5 GPM to 0.35 GPM) are lower when compared to flow rates of standard manual lavatory faucets (1.2 GPM)
- Minimize risk of wasted water due to a user turning on a faucet and forgetting to turn it off

Sensor faucets **elevate the overall look** of a restroom.

- The absence of handles and buttons creates a streamlined look and minimizes standing water on the faucet deck
- Design options range from transitional to ultra-modern to fit any space

*Check the CDC website regularly for updated information at www.cdc.gov

Which Sensor Faucet is Right for Me?

We have the manufacturers and models that fit your space and needs. Considerations for choosing a sensor faucet include:

- 1. Deck Format** - Ensure you have the right faucet and deck plates to cover existing sink or counter holes.
 - a.** Single hole
 - b.** 4" centerset
 - c.** 8" widespread
- 2. Power Source** - Choose the right power option based on available hookups and the level of anticipated restroom traffic.
 - a.** Battery/DC - This is the most common power source for sensor faucets in low- to mid-traffic restrooms. It is cost-effective because no outlet is required (faucets run on standard AA batteries).
 - b.** AC - This power source can be used with an electrical outlet. It is generally used in higher-traffic restrooms to eliminate battery replacements.
 - c.** Hardwire - This power source is typically found behind the wall in new construction or complete rehabs. It is also used when vandalism is a concern.
 - d.** Eco-Friendly/Hybrid - Some manufacturers offer alternative power options, such as solar or turbine energy harvesting. These options are ideal for mid- to high-traffic applications where energy consumption and high battery replacements are a concern.
- 3. Mixing Options** - Always check local codes for requirements of thermostatic mixing valves at the faucet where there are hot and cold water lines.
 - a.** Above-Deck Mixing - Allows for water temperature adjustment on the faucet. It is not recommended for restrooms where vandalism is a concern.
 - b.** Below-Deck Mixing - The mixing valve is under the counter, so the facility manager can set the temperature.
- 4. Flow Rate** - Always check state and local codes for flow rate limitations before choosing a faucet. For example, California mandates a max flow rate of 0.5 GPM in public restrooms.
- 5. Value-Added Features** - Manufacturers offer additional options to make installation and maintenance more efficient. Those options include:
 - a.** Extended life battery packs to minimize labor and battery replacements
 - b.** Remote controls to alter functions and temporarily pause functions for easy cleaning
 - c.** Bluetooth® capability to monitor and manipulate faucet functions from anywhere using a central app
